

Engagement Rising: A Decade of CCSSE Data Shows Improvements Across the Board

**Report Supplement
and Methodology**

For more than 10 years, the Center for Community College Student Engagement has worked with colleges across the country to understand and improve student engagement. Between 2001—the year the Center was created—and 2004, Center staff researched, identified, and refined items that measure different aspects of student engagement. Based on this research and guidance from a Technical Advisory Panel, the Community College Survey of Student Engagement (CCSSE) item set was finalized in 2004.

After 11 years, the interesting is whether student engagement changed over time. Select results from this investigation are published in a national report, [*Engagement Rising: A Decade of CCSSE Data Shows Improvements Across the Board*](#). The results for the full set of 152 CCSSE items are presented in this report supplement. (Please note that the last item on CCSSE (#37: Student's major) was not included in this analysis because not all colleges use the list of majors provided by the Center; therefore, the coded values are not consistent across all colleges.)

The first section of this supplement presents the methods used to create the analysis data set. This is followed by a brief codebook describing how the items were recoded for the analysis. The final section presents the annual trend data for each item, consisting of graphical and tabular presentations of each item for all students, students broken out by enrollment status (part-time and full-time), and developmental status (developmental and non-developmental).

Part I. Methods

Data Preparation

Data for the analysis presented here consist of the respondents from each annual administration of CCSSE from 2004 through 2014. Unlike the Center's normal analyses based on three-year cohorts in which only the most recent administration data for a college are included in a given analysis, data from every administration are included here. For example, if a college participated every year from 2004 through 2014, data for all 11 administrations of CCSSE are included in the analysis data set. As with all other national analyses, the usual [exclusion criteria](#) apply. Oversample respondents were also not included in the analysis data set. The final analysis data set includes 1,887,781 respondents.

To simplify the analysis and the presentation of the results, the original response options to the CCSSE items were recoded. The majority of the items were recoded into dichotomous responses (e.g., *Never*, *Sometimes*, *Often*, and *Very often* were recoded to *Ever* vs. *Never*). Other items, in which a single cut-point was not clear, were recoded into three or four response categories (e.g., number of papers written: *None*, *1-4*, *5-10*, *11-20*, and *More than 20* were recoded to *None*, *1-4*, and *5 or more*). The recoding for all response scales and the corresponding variable names are presented in Part II of this document.

Item 13 on the survey asks about the use of, satisfaction with, and importance of 11 student services. Because responses to the second and third parts of these items are dependent on a

student's response to the first part, special coding of these items was required. If a student responded he or she did not know if he or she used a service or the service was not applicable to him or her (response option: *Don't know / N.A.*) or if a student skipped the item, the satisfaction and importance sub-items were coded as missing, thus removing that respondent from the pool of respondents used to calculate the percentages for these parts of Item 13. The logic for this is that if someone doesn't know if he or she used a service or the service wasn't applicable, he or she has no basis for judging satisfaction with that service. While it is possible for someone who does not use a service to think that service is important to offer because it could be critical to someone else's ability to attend the college, the importance variable was also coded as missing so that only responses for students who actually used the services at least once contributed to the percentages for the importance sub-part of these items.

The Frequency procedure in SAS was used to calculate the frequencies and percentages of students responding to all items on the main CCSSE survey. Frequencies and percentages are reported for all students as well as breakouts for enrollment status (part-time and full-time) and developmental status (developmental and non-developmental). A [detailed description](#) of how these breakouts are defined can be found on the Center website.

The process used to create the random sample each year is known to have a bias in favor of over-selecting full-time students. To account for this, the Center creates weights for each student so that analysis results are adjusted to reflect the actual population at each college. A [complete description of the weighting procedure](#) can be found on the Center's website. Accordingly, the all-student analysis and the breakout analysis by developmental status were weighted. The breakout analysis by enrollment status was not weighted.

The results of the analysis are presented in both tabular and graphical format in Part III of this supplement. Each page includes a title identifying the variable reported on that page and whether the data represent all students or a breakout subgroup. For ease of aligning this report with a copy of the survey, the results are presented in the order the items appear on the survey. Due to space limitations, the national report only includes a select set of items where the difference between the lowest percentage of students and the highest percentage of students responding in a positive direction (e.g., never skipping class or ever making a presentation in class) was at least seven percentage points. This supplement includes all items, regardless of the amount of change over time.
